# CHAPTER V

## SUMMARY OF FINDINGS, CONCLUSIONS, AND RECOMMENDATIONS

### Summary of Findings

*The Summary of the Study presents a concise narrative of the entire research study. It should be written in paragraph form and should provide a logical flow of the study from its purpose to its major results. The summary should not simply copy the contents of Chapters I to IV. Instead, researchers should synthesize the most important information from the previous chapters into a clear and coherent discussion.*

*The summary should include the following in a logical sequence:*

- *Purpose of the Study – State the problem or need addressed by the study and why the system was developed.*
- *Research Objectives – Present the general purpose and major objectives of the study in narrative form.*
- *Methodology – Briefly describe the research/development approach, respondents or evaluators, data-gathering instrument, and evaluation procedure.*
- *System Design and Development – Describe the major system components or modules developed.*
- *Testing – Mention the testing procedures conducted, such as unit testing and integration testing.*
- *Evaluation – Describe how the completed system was evaluated and identify the evaluation criteria used.*
- *Major Findings – Summarize the most important results obtained from the study, including relevant overall results or interpretations.*

*For a typical system-development research study, the Summary of the Study may consist of a maximum of 2 paragraphs.*

### Conclusions

*The Conclusion presents the overall meaning of the findings of the study. It should explain what the researchers can conclude based on the results presented in Chapter IV and should directly address the research objectives. The conclusion should not introduce new information, data, or results. It should be derived only from the findings of the study.*

*Guidelines for Writing the Conclusion*

- *Base each conclusion on an actual finding.*
- *Every conclusion should be supported by the results presented in Chapter IV.*
- *Follow the research objectives.*
- *Organize the conclusions according to the sequence of the research objectives.*

- *Write in paragraph form.*
- *Conclusions should be presented as clear, connected statements rather than simply repeating tables or statistical results. Interpret the findings.*
- *Do not merely repeat the numerical results. Explain what the findings indicate in relation to the objective.*
- *Be specific and evidence-based.*
- *Avoid broad claims that cannot be supported by the study.*
- *Do not introduce new information.*
- *Information not discussed in Chapters IV should not appear for the first time in the conclusion.*
- *Do not include recommendations in the conclusion.*
- *Suggestions for improvement should be placed in the Recommendations section.*

## Recommendations

*The Recommendations section presents specific actions that may be undertaken based on the findings and conclusions of the study. Recommendations should identify possible improvements, enhancements, implementations, or future research directions. Recommendations should be practical, specific, and directly connected to the findings.*

*Guidelines for Writing Recommendations*

- *Base recommendations on the findings. Each recommendation should address an issue, limitation, user feedback, or opportunity identified during the study.*
- *Make recommendations specific. Clearly state what should be done and, when appropriate, how it can be done.*
- *Identify the intended recipient. Recommendations may be directed to: System administrators, Management, End users, System developers, Implementing offices, Future researchers*
- *Prioritize practical improvements. Recommendations should be feasible within the context of the system and organization.*
- *Include future enhancements when appropriate. Features or functions not included in the current version may be proposed for future development.*
- *Consider system maintenance. For deployed systems, recommendations may include database backup, security updates, monitoring, maintenance, and user training.*
- *Consider future research. Future researchers may expand the study through additional respondents, longer implementation periods, other locations, additional variables, or other evaluation criteria.*
